

Vision

JobScan is an AI-powered platform that finds Product Management jobs with visa sponsorship. Every day it fetches jobs from multiple sources, scores them based on sponsorship likelihood and relevance, generates customised CVs, cover letters and application tracking.

Overview

PRODUCT PRINCIPLES

1. Modularity: Every module must function standalone and compose with others.
2. Low-cost infra: Build with free-tier tools where possible.
3. Privacy-first: All data belongs to the user.
4. Iteration over perfection: Each module can evolve independently.

Available subscriptions

1. Google AI Pro subscription
2. Claude Pro subscription
3. Apify LinkedIn Job scrapper Actor if required

Journey so far

All of these are available as reusable workflows today as in, I have created individual projects and added instructions and files to achieve each of the use cases.

1. **Job scorer:** This skill evaluates a job opportunity and assigns a score based on several factors such as Visa, Domain and relevance.
2. **Company Profile** - This skill will create a 2 page report of each company. Upon shortlist, this shall be generated. The design, format, python file and instructions are readily available for usage.
3. **CV optimiser** - This skill is used for customising the resume according to each job based on the JD mentioned. This skill makes sure of ATS format check, call out domain gaps, prepares a crisp one pager CV and cover letter and undergoes an adversarial pass at the created resume to validate ATS, domain and coherency.
4. **Message generator** - Ability to send curated mails/ message to Recruiter/ Referrer/ Hiring Manager
5. **Technical Interview Preparation** - A skill to generate a book (pdf) with clear chapters is created when subject matter and the gaps to be covered are provided as inputs.
6. **Case Study Preparation** - This is a skill that relies on a one time generated book (covering frameworks and examples for each type of case study) to train an individual to crack case interviews.
7. **Application Tracker** - Maintained as a sheet in Google. No analytics.

Journey ahead

1. **Job Ingestion** - This part of the process is manual at this point. The user goes to linkedin, finds suitable jobs and manually calculates the score, customises the CV, generates outreach responses as individual sequential steps before applying for the role. The vision of this module is to auto fetch jobs across multiple recognised portals, apply pre qualification filters such as location, role, domain and relevance and populate it on the dashboard. This feature is also expected to provide a back door to upload jobs fetched manually through excel based approach.
2. **Application Management** - Unified dashboard displaying all applicable jobs which are ready to apply, already applied, etc. Each job in this section becomes an application with the following sections.
 - a. **Resume** - CV and CL customised and generated for this role, ready to be downloaded.
 - b. **Job Score** - Post qualification Job score generated along with the analysis
 - c. **Application status** - Ability to update the status
 - i. Applied
 - ii. Shortlisted
 - iii. Interview
 - iv. Rejected - Shortlist
 - v. Rejected - Screening
 - vi. Rejected - Interview
 - vii. Rejected - Visa
 - viii. Deemed Rejected (after 2 weeks of no response)
 - ix. Offer
 - d. **Referral** - Add referral status if any for this role.
 - e. **Outreach** - Generate custom messages out of the predefined formats in this section and send it through LinkedIn/ gmail.
 - f. **Application attempt** - For some jobs, sending a fresh application with a new email id for a job already applied at the right time generates a shortlist. Need to capture the same.
3. **Application Analytics** - Need to track metrics to understand the performance of the application and candidate for visibility purposes.
 - a. **Total Application**
 - b. **Awaiting Response**
 - c. **Shortlist Rate**
 - d. **Interview Rate**
 - e. **Rejection Rate**
 - i. Rejection post Interviews
 - ii. Rejection post Screening
 - iii. Rejection post application
 - f. **Ghost Rate**
 - g. **Conversion Rate**
 - h. **Filters** - geography, dates, referral - Yes/No

High level user flow

1. Discover & Ingest

Fetch jobs periodically across configured job boards, verified company career sites, and manual uploads.

2. Pre-Qualification

Apply deterministic filters for role, domain, experience, location, freshness and duplicates/reposts to remove low-value jobs.

3. Job Scoring & Categorization

Deep-score qualified jobs and classify them into **Perfect Match**, **Dicey Match**, or **Rejection Pool**, with referral requirements flagged.

4. Material Generation

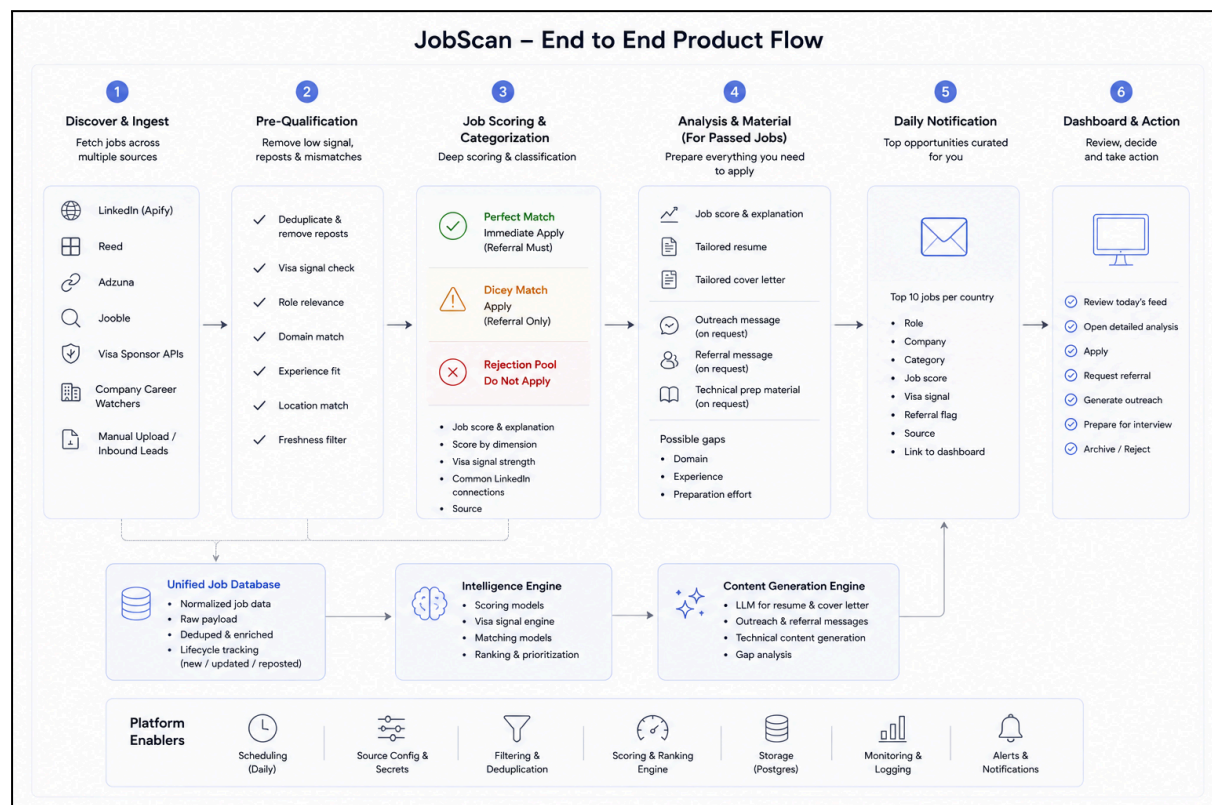

For high-potential jobs, generate tailored resumes, cover letters and identify domain/experience/preparation gaps. Generate outreach, referral and technical-prep material only on request.

5. Daily Notification

Send the **Top 10 jobs per country** with key signals, score, category, referral flag and dashboard link.

6. Dashboard & Action

The user reviews the curated feed, examines the analysis, applies, requests a referral, generates outreach/preparation material, or rejects the opportunity.

Tech & Infra Architecture

Layer	Technology	Recommendations by ChatGPT and Gemini	Cost
Frontend	Next.js + React + Tailwind	Use one framework instead of separate React frontend/backend concerns. Easy for Claude Code to scaffold and iterate.	₹0
Backend	Next.js API Routes / Server Actions initially	Avoid a separate Python/FastAPI server unless you actually need it.	₹0
Database	Supabase PostgreSQL Free	Best fit because you also need file storage, auth later, and a simple dashboard.	₹0
ORM	Drizzle ORM	Prefer over SQLAlchemy for this project because it keeps the stack TypeScript/Next.js-native.	₹0
AI	Claude API / existing Claude workflow	Reuse your existing Claude skills wherever possible.	Existing subscription
AI Review	Gemini + Antigravity	Development/review layer, not application runtime.	Existing subscription
Job Extraction	Apify	LinkedIn and other difficult sources.	API Usage

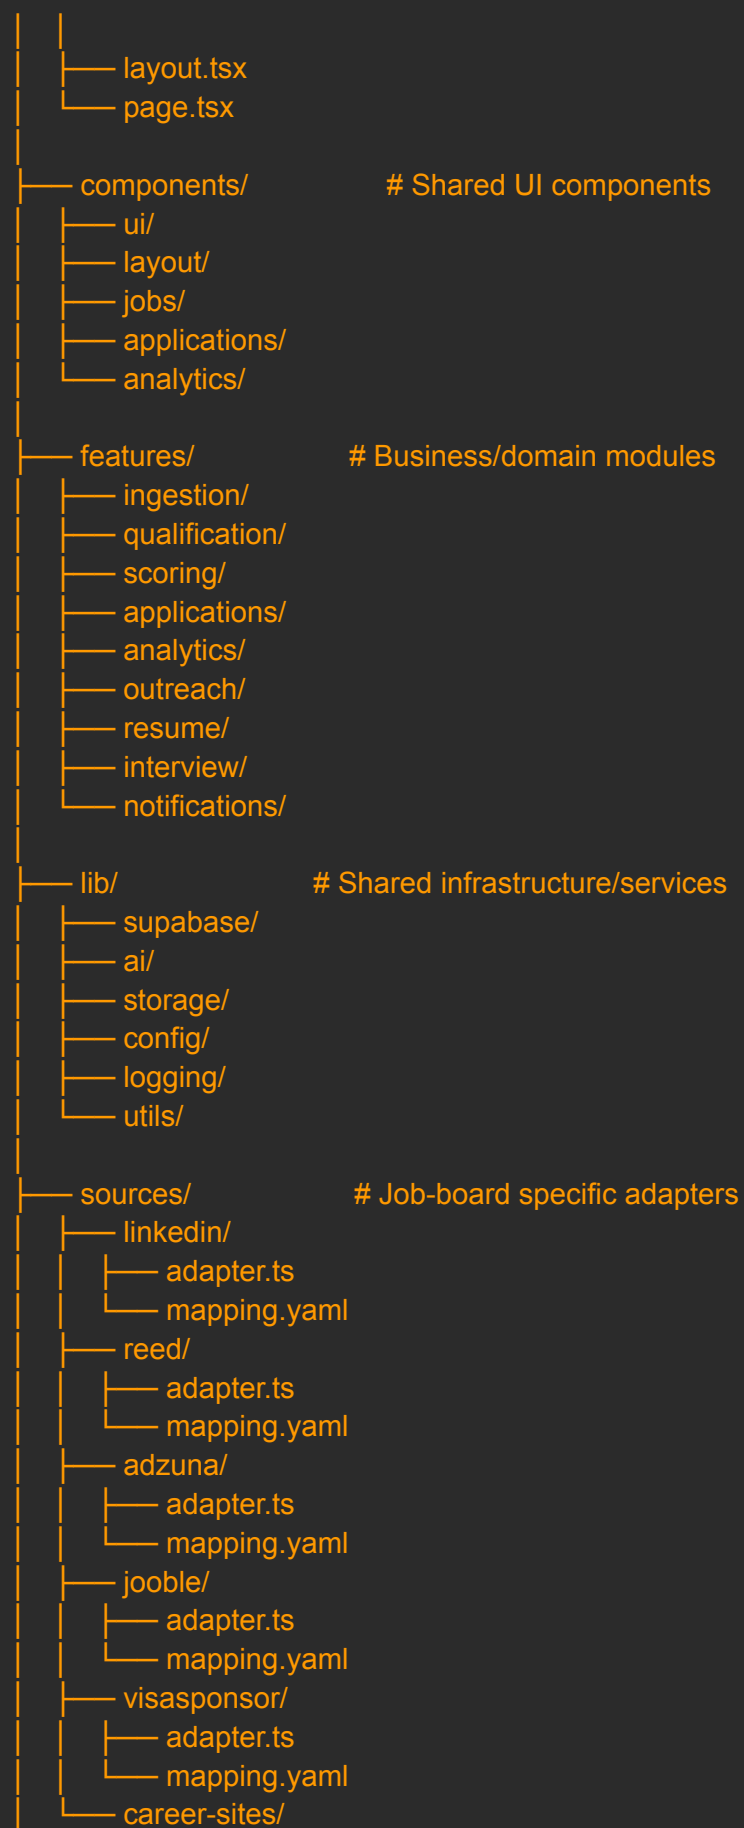

Scheduler	GitHub Actions	Daily CRON is more than enough.	₹0
Background Jobs	GitHub Actions	Don't introduce Redis/Celery/queues.	₹0
File Storage	Supabase Storage	Store resumes, CLs, PDFs, interview material and application documents.	₹0 within free limits
PDF	No PDF library initially	Continue using Claude-generated reports/PDFs. Introduce a local library only if a measurable need emerges.	₹0
Git / CI	GitHub	Source control + Actions + versioning.	₹0
Hosting	Vercel	Host Next.js application using your existing account/free tier.	₹0

MODULE ARCHITECTURE

1. Ingestion

Responsible for finding, fetching, and normalizing job data from the Internet

- **Fetcher** - Fetch Jobs on periodic basis
- **Watcher** - Fetch jobs from verified Visa sponsorship providing company career page -
- **Upload** - File based upload of jobs into the system. If I find a job outside any of the job boards configured or through any of the inbound leads, I will create a job in this system through this upload.
- **Pre Qualification filters** - Filter based on domain, role, experience, and location each job will be filtered into New, updated, reposted, duplicate job
- **Notification** - Daily Mailer of summary of Jobs fetched

2. **Intelligence - Available**
3. **Optimization - Available**
4. **Applications - MD file attached**
5. **Preparation - Available**
6. **Insights - MD file attached**
